

GMZ Track AI - User Manual

Preliminary Edition 2026

1. What is GMZ Track AI?

GMZ Track AI is a DJ-focused tool designed to simplify work with music libraries, external drives and file paths. Its purpose is to reduce interruptions and keep your workflow fast during preparation and live DJ use.

2. Quick start

Open GMZ Track AI, select or confirm the location of your library and make sure the required external drives are connected. If a drive changes or is mounted again, use the reconnection function to restore access.

3. Drive reconnection

When a library becomes unavailable because an external drive was disconnected or its path changed, GMZ Track AI helps associate the correct location again without rebuilding the entire organization manually.

4. Mini / DJ Mode

Use the compact view when you want GMZ Track AI to remain available while working with other applications. It is designed to use little screen space and provide fast access to essential actions.

5. Always on Top

Enable Always on Top to keep the GMZ Track AI window above other applications. This is especially useful during set preparation or whenever you need immediate access to the app.

6. Language

The interface is prepared for Spanish, German and English. Change the language from the application preferences.

7. Initial compatibility

The first stage is intended for macOS Monterey 12 or later on Intel Macs. Apple Silicon / Universal compatibility is planned for a later development phase.

8. Best practices

Keep backups of your music library. Eject external drives correctly. Before a performance, verify paths, drives and file access. GMZ Track AI helps manage the workflow, but it does not replace a proper backup strategy.
